

OPERATOR INTELLIGENCE FOR MANUFACTURING

Find the improvements your machines can't see.

How manufacturing companies turn the knowledge of their best operators into measured, repeatable improvement, proven on the floor in ten weeks.

Built for operations under pressure to improve.

Rising feedstock prices, rising energy costs, tougher global competition. When performance has to improve and there is no time for a two-year IT project, four things matter.

Results inside one quarter

From first data access to a verified improvement on the floor in roughly 90 days. Fast enough to show up in this year's numbers, not the next owner's.

Operating cost, not capex

No hardware, no infrastructure, no integration project. A fixed fee that sits within local management's mandate, with no board approval cycle needed to start.

EBITDA levers you already own

Scrap, unplanned stops, changeover losses, reporting hours. The improvement potential is already inside the plant. It is just not visible yet.

A repeatable playbook

The same method transfers from line to line and site to site. Prove it once, then roll it out wherever the pattern repeats. Configuration and learnings carry over.

Every step is fixed-fee and stops whenever the numbers say stop: the risk profile of a diagnostic, the outcome of an improvement program.

Your dashboards say what happened. Not why.

Every plant steers on numbers, and every plant has questions the numbers can't answer.

The answer exists. It is just never recorded.

- | | | |
|----|--------------------------------------|--|
| 01 | Something changes on the line | A different infeed, a machine running slightly off, an operator quietly adjusting: the small events that decide the outcome. |
| 02 | The effect shows up later | In scrap, an unplanned stop, a failed lab result, a complaint. Hours, days, sometimes weeks after the cause. |
| 03 | Cause and effect are lost | The <i>whys</i> sits with whoever was on shift. Part memory, part Excel, part paper log. Unusable when you need it. |

What your **operators see, hear and decide** is your most valuable operational data, and thirty years of it walks out at every retirement.

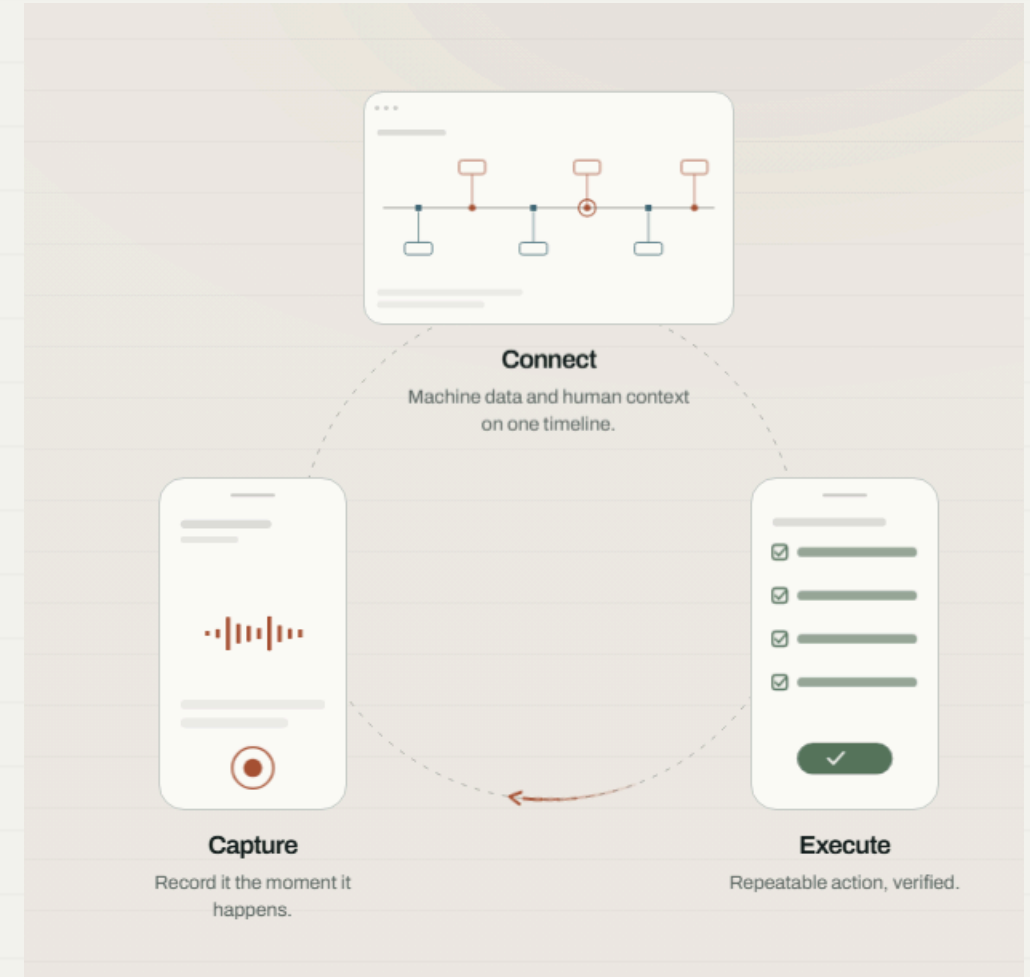

Capture. Connect. Execute.

 **Capture:** record what operators see, the moment it happens.

 **Connect:** machine data and human context on one timeline.

 **Execute:** a repeatable action, verified on the floor.

One system for the complete operational loop, not a stack of tools. No new hardware: it works with your current systems, or without any SCADA at all.

What changes when the floor becomes visible.

Decisions on evidence, not memory.

Conditions, observations, actions and outcomes: the whole story in one place.

Your best people's knowledge, kept.

Senior judgement captured and shared across shifts, not lost at the next retirement.

Root causes in days, not weeks.

Repeat problems stop repeating once cause and effect finally share a timeline.

Improvements that stick.

Every fix is executed and verified on the floor, so it stays the standard.

VERIFIED REFERENCE CASE

EUROPEAN PLASTICS PLANT • MID-SIZE, MULTI-LINE EXTRUSION •
PROOF + IMPLEMENTATION

30%

less scrap on the line under investigation

40%

fewer stoppages from the recurring fault

5 hrs/wk

less reporting time reconstructing the
shift

90 days

from kickoff to implemented value

Reference call available on request.

What operations leaders say.

“

Two weeks after starting with Oppr, our operators captured more useful information than we'd collected in the previous decade on paper logs and Excel.

WHAT WE DID

- Connected ERP quality data, hand-kept Excel parameters and LIMS results
- Surfaced the golden recipe behind first-time-right output

Operations Director
PVC extrusion • Netherlands

“

One operator observation prevented a € 55,000 bearing failure. The system flagged a pattern we'd never have caught with sensors alone.

WHAT WE DID

- Captured operator observations alongside machine data
- Flagged an early failure pattern sensors alone missed

Operations Director
Chemical manufacturing • Amsterdam

“

We always used our output data and our mass balance to work out what happened. We could never pinpoint the impact of the changing feedstock.

WHAT WE DID

- Captured operator input on top of the existing machine data
- Linked feedstock changes to how the line actually ran

Operations Director
Waste incinerator • Netherlands

What one improvement is worth. Then multiply it.

The figures below are a single improvement, on a single line, on deliberately conservative assumptions. Most plants run several lines across several sites, and the same method repeats on each.

€ 50k

Recurring unplanned stops

Recover around 20 production hours a year at € 2.500 per lost hour.

€ 100k

Off-spec & rework

0,5% less off-spec output on € 20M of annual production value.

€ 15k

Reporting & reconstruction

Five hours a week of engineer and supervisor time won back.

€ 50-100k per line, per year × **your lines and sites.** One verified improvement, repeated wherever the pattern shows up. Illustrative, not a promise.

Entry: € 10.000, fully credited. Total to a verified improvement: € 25.000 all-in. One avoided stoppage-day roughly pays for the analysis. You know your payback *before* the Proof starts.

From first look to yearly impact, in three steps.

Each step earns the next. Fixed fees, no surprises. Stop whenever the numbers say stop.

STEP 1 · ANALYZE

Historical data analysis

€ 10.000

fixed · 2-3 weeks · 100% credited

Your blind spots, KPI targets and payback, from data you already have.

STEP 2 · PROVE

The 10-Week Proof

€ 25.000

fixed, all-in, regardless of hours

One line, one blind spot, criteria signed up front. A verified improvement by week ten.

STEP 3 · SCALE

Annual agreement

Priced on operational size

scoped on lines, sites and modules · 50% of the Proof fee credited on conversion

The verified improvement becomes standard practice and expands to the next line and site.

WHAT WE NEED FROM YOU · a sponsor (~1 hour/week) · a small team (2-3 operators, minutes per shift) · historical data access (NDA)
· site access during the Proof · a feedback round every two weeks · everything else is inside the fixed fee

Built with operators, not against them.

Adoption is the whole game. A tool operators skip is worthless, so Oppr is built to make contributing effortless for everyone on the floor, and to turn what they know into one shared body of knowledge.

Twenty seconds, in any language

Speak, snap a photo or read a screen, in the flow of work. AI turns it into structured data, so the operator who never filled in a form, or does not speak the local language, finally contributes the knowledge in their head.

One combined body of knowledge

Every operator and every shift adds to the same record. The know-how that used to walk out with individuals becomes something the whole plant can use, and keep. Nothing is lost because someone could not write it down.

Knowledge, not surveillance

Oppr captures what the line is doing and why, never individual performance. There are no individual operator KPIs, rankings or monitoring in the product.

Works-council ready

Transparent purpose, GDPR-compliant, EU-hosted data, and clear boundaries on what is and is not recorded. We support the conversation with your employee representatives.

Adoption is measured, not assumed: “operators actually use it” is a signed Proof success criterion.

WHO WE ARE

Operators who build software, not a software company guessing at operations.

Oppr was built on the shop floor by people who ran it. Our founding lesson: the data and the knowledge already exist on the floor; what is missing is a way to keep them.

FOUNDED	2023 · The Hague, NL
TEAM	10+ people, with three industry experts of 15–30 years each
BACKING	Recently closed a significant venture round with leading industrial-tech investors
FOCUS	Manufacturing only: process and discrete
DATA	EU-hosted · GDPR-compliant
WEB	oppr.ai

Humans are sensors

The people on the floor are the most capable sensors in any factory. They sense what no instrument records. Our job is to turn that into a data source.

Operators first

Technology adapts to how people work, not the other way around. If operators will not use it by choice, it has failed.

Built for execution

Not another dashboard that shows a problem and stops there. We are operators by heart: getting it done is the point. Continuous improvement is not software, it is a change in how you work, and it only exists if you execute it, consistently.

Founded by Floris Wyers *after 15+ years running production in process industry: “We created Oppr so you never have to guess what is happening on your own floor again.”*

NEXT STEP

See your own blind spots before the year does another lap.

1

A 30-minute call

Pick the plant, the line and the recurring question that costs you the most.

2

Historical data analysis

2–3 weeks from data access. Your blind spots, KPI targets and payback on the table.

3

Decide on a 10-Week Proof

With your own numbers, and the € 10.000 fully credited if you proceed.

Best attended by operations leads together with a process expert.
